

Bar-Tec® Rejector slotted screen baskets

Efficient coarse screening

Bar-Tec® Rejector for coarse screening

Improved efficiency and higher capacity

The performance of coarse screening has a significant effect on the following process stages. Bar-Tec® Rejector screen baskets enable to achieve optimal impurity reduction already in the primary screening, which again relieves the following screening stages and provides higher efficiency through the whole screening line.

Bar-Tec® Rejector screen basket is an alternative for drilled baskets in the coarse screening. The special profile wire, developed by ANDRITZ Fiedler, and a diagonal slot geometry generate special flow direction resulting in higher reject removal.

Benefits

- **Higher capacity**
- **Lower energy consumption**
- **New profile geometry**
- **Reverse flow**
- **Improved efficiency**
- **Available for all screen types**
- **High mechanical strength**
